

STM32MPU distribution for Android

The **STM32MPU distribution for Android™** runs on Arm® Cortex®-A processors. It is a subset of the STM32MPU Embedded Software distribution for Android.

It includes the following collection of software components:

- The **OpenSTLinux BSP** that offers services for the application frameworks in the same context:
 - The **boot chain** based on **TF-A** and **U-Boot**.
 - The **OP-TEE** secure OS running on the Cortex-A core in Secure mode.
 - The **Linux® kernel** running on the Arm® Cortex®-A core in Non-secure mode.
- **Application frameworks** that rely on the services provided by the **OpenSTLinux BSP** to provide specific functionalities (such as code libraries, APIs and tool sets) to ease the development of software applications:
 - **OP-TEE** application frameworks running in the secure OS user space (eg TEE Internal core API for the development of Trusted Applications (TA)).
 - **Android** application frameworks running in Linux OS user space (see AOSP^[1] for more details).

The **OpenSTLinux BSP for Android** has some specificities:

- The Linux kernel source is based on the Common Kernel available in AOSP^[2].
- The Linux kernel configuration is based on the reference configuration available in AOSP^[3].

Android application frameworks are based on the AOSP platform manifest^[4]. By default, one of the Google tags^[5] is used as a reference.

The **Google services** (ex: Cast, Drive, Maps...) are neither embedded nor validated within this **STM32MPU distribution for Android™**.

1 How to get the software for this distribution?

The **STM32MPU distribution for Android™** is available through the three Packages (Starter, Developer, and Distribution) of the STM32MPU Embedded Software distribution for Android.
