1 Article purpose

This article provides some information about the sysfs pseudo filesystem usage from the user space.

2 Sysfs (/sys) pseudo filesystem

Sysfs provides a mean to export kernel data structures, their attributes, and the linkages between them to the user space.

Please refer to [sysfs part of pseudo filesystem page](#).

3 Sysfs usage

Linux kernel provides a documentation^[1] about the rules for sysfs usage.

Some examples are also described below with two different approaches for using sysfs entries from the user space:

- Linux application in C language
- bash script.

3.1 Example from Linux application

The below example is a typical sequence for using sysfs entry (here a PWM component):

- open a file descriptor of the sysfs entry file

```
10 len=snprintf(buf, sizeof(buf), "/sys/class/pwm/pwmchip0/pwm%d/duty_cycle", pwm_channel);
11 fd = open(buf, O_RDWR);
```

- if fd is correctly opened, write/read value in the file: pay attention to the "text" format

```
12 if (fd < 0)
13 {
14     perror("pwm/duty_cycle");
15     return fd;
16 }
```

- read: store data to buffer

```
18 read(fd, buf, sizeof(buf));
```

- write: write data from buffer

```
20 len = snprintf(buf, sizeof(buf), "%d", 900000);
21 write(fd, buf, len);
```

- close file descriptor

```
30 close(fd);
```

3.2 Example for shell command / bash script

Operations on sysfs entries can be done by using command lines (i.e. *echo* for writing, *cat* for reading).

In this way, it is possible to use a bash script to execute a configuration sequence, similarly to what a user would do by typing multiple shell commands.

An example is provided in [How_to_use_PWM_with_sysfs_interface](#).
