Android tracing, monitoring and debugging

Stable: 09.10.2019 - 13:23 / Revision: 18.09.2019 - 07:48

This article provides useful information to start using Android™ tracing, monitoring and debugging environments.

Contents

1 Specific Linux® tracing and debugging tools	3
2 Android tools	3
2.1 Application debugging	3
2.2 adeb	3
2.3 logcat	4
2.4 perfetto	4
3 References	4

1 Specific Linux® tracing and debugging tools

In Android™ various Linux tracing and debugging tools are available. To get the global picture, refer to [Linux tracing, monitoring and debugging page](#).

2 Android tools

2.1 Application debugging

You can use Android Studio to debug your Android application. Please read the official documentation about Android Studio [\[1\]](#).

2.2 adeb

adeb (also known as androdeb) provides a powerful Linux shell environment where one can run popular and mainstream Linux tracing, compiling, editing and other development tools on an existing Android device. All the commands typically available on a modern Linux system are supported in adeb.

It consist in installing a Debian distribution into the Android system itself to execute more debug commands.

For more information refer to the [ADEB page](#).

2.3 logcat

The Android logging system provides a mechanism for collecting and viewing system debug output. Logs from various applications and portions of the system are collected in a series of circular buffers, which then can be viewed and filtered by the `logcat` command. Use `logcat` from an [ADB](#) shell to view the log messages.

For more information refer to the [Android developer site](#)^[2].

2.4 perfetto

Perfetto is an open-source project for performance instrumentation and tracing of Android platforms and user-space apps.

For more information refer to the [perfetto](#) page.
