## 1 Article purpose

This article explains how to configure *Bluetooth* <sup>[1]</sup> when the peripheral (or peripheral associated to the framework) is assigned to the Linux<sup>®</sup>OS.

The configuration is performed using the **device tree mechanism** <sup>[2]</sup>.

The Bluetooth companion chip chosen on our platform is a Cypress chip <sup>[3]</sup>

## 2 Bluetooth DT bindings documentation

The *Bluetooth* <sup>[4]</sup> tree bindings are composed of:

- STM32 USART device tree bindings <sup>[5]</sup>
- The Cypress device, used as child node <sup>[6]</sup> of the host USART device to which the slave device is attached.

## 3 Bluetooth DT configuration

This hardware description is a combination of the STM32 microprocessor device tree files (.dtsi extension) and board device tree files (.dts extension). See the device tree for an explanation of the device tree file split.

## 3.1 Bluetooth DT configuration (STM32 level)

The USART peripheral node is located in *stm32mp157c.dtsi*

- This is a set of properties that may not vary for given STM32 device, such as: registers address, clock, reset...

The USART DT configuration is explained in [Serial TTY device tree configuration](#)

## 3.2 Bluetooth DT configuration (board level)

```
&usart2 {
    st,hw-flow-ctrl; /* enable hardware flow control */
    bluetooth { /* node of Bluetooth companion chip
*/
        pinctrl-names = "default";
        pinctrl-0 = <&btreg>; /* GPIO to power up or down the
internal companion chip regulators */
        compatible = "brcm,bcm43438-bt";
        max-speed = <3000000>;
    };
};
```

Specific properties for USART:

- btreg: GPIO to power up or down the internal CYW4343W regulators used by the Bluetooth section
- st,hw-flow-ctrl: bool flag to enable hardware flow control

## 4 How to configure Bluetooth using CubeMX

The *STM32CubeMX* tool can be used to configure the *STM32MPU* device and get the corresponding platform configuration device tree files.

The *STM32CubeMX* may not support all the properties described in the above [DT bindings documentation](#) paragraph. If so, the tool inserts **user sections** in the generated device tree. These sections can then be edited to add some properties and they are preserved from one generation to another. Refer to *STM32CubeMX* user manual for further information.
