## 1 Article purpose

The purpose of this article is to

- briefly introduce the CRC peripheral and its main features
- indicate the level of security supported by this hardware block
- explain how each instance can be allocated to the three runtime contexts and linked to the corresponding software components
- explain how to configure the CRC peripheral.

## 2 Peripheral overview

The **CRC** peripheral is used to verify data transmission or storage integrity.

### 2.1 Features

Refer to the [STM32MP15 reference manuals](#) for the complete list of features, and to the software components, introduced below, to see which features are implemented.

## 2.2 Security support

CRC1 and CRC2 are **non secure** peripherals.

# 3 Peripheral usage and associated software

## 3.1 Boot time

CRC instances are not used at boot time.

## 3.2 Runtime

### 3.2.1 Overview

CRC instances can be allocated to:

- the Arm® Cortex®-A7 non-secure for using in Linux® with Linux Crypto framework

or

- the Arm® Cortex®-M4 for using in STM32Cube with STM32Cube CRC driver

Chapter [Peripheral assignment](#) describes which peripheral instance can be assigned to which context.

### 3.2.2 Software frameworks

Do	Peri	Software frameworks			Comment
mai Cor tex -A7 sec ure (O P- TE E)	Cor tex -A7 no n- sec ure (Li nux )	Cortex-M4  (STM32Cube)			
			Linux Crypto framework	STM32Cube CRC driver	
Se cu rity	C R C				

### 3.2.3 Peripheral configuration

The configuration is applied by the firmware running in the context to which the peripheral is assigned. The configuration can be done alone via the [STM32CubeMX](#) tool for all internal peripherals, and then manually completed (particularly for external peripherals), according to the information given in the corresponding software framework article.

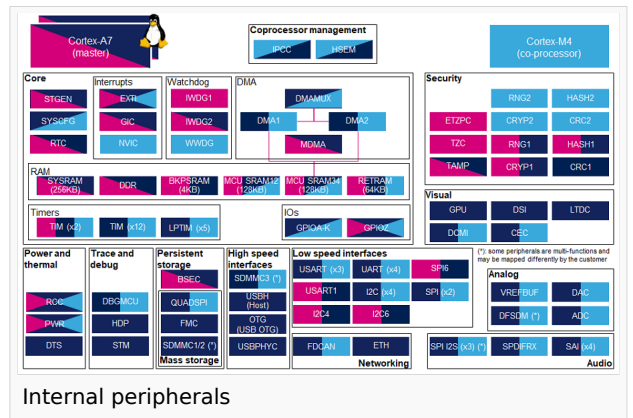

### 3.2.4 Peripheral assignment

**Check boxes** illustrate the possible peripheral allocations supported by [STM32 MPU Embedded Software](#):

- means that the peripheral can be assigned ( ) to the given runtime context.
- is used for system peripherals that cannot be unchecked because they are statically connected in the device.

Refer to [How to assign an internal peripheral to a runtime context](#) for more information on how to assign peripherals manually or via [STM32CubeMX](#).

The present chapter describes STMicroelectronics recommendations or choice of implementation. Additional possibilities might be described in [STM32MP15 reference manuals](#).

Do	Per	Runtime allocation				Comme
ma	in	Cortex-A7 non-secure (Linux)	Cortex-M4 (STM32Cube)
