5 Focus on the Distribution Package directory	11
6 Appendix A: directory structure after build (Developer Package)	13
7 Appendix B: directory structure after build (Distribution Package)	16

1 Article purpose

This article aims at proposing a way to organize, on the host PC, the software packages of the different Packages (Starter, Developer and Distribution) for a given release of the STM32MPU Embedded Software distribution.

The main objective of the proposed organization is to keep together the software packages corresponding to a given release because there are links between them. For example:

- Flashing the image from the Starter Package on the board is mandatory before modifying the source code from the Developer Package. Both the image and the source code must belong to the same software release.
- The SDK (Developer Package) and the image (Starter Package) have both been generated from the Distribution Package. A software release thus guarantees that there is no misalignment between the different software packages.

An example of organization for tools is proposed [here](#).

Information

The objective of this article is to describe one organization among all the possible organizations. Feel free to organize the delivered Packages in any other way that would better match your way of working.

Information

In practice, this article uses the release **STM32MP15-Ecosystem-v1.0.0** for the STM32MPU Embedded Software distribution as an example to illustrate the proposed organization. If you are using a different release, the names of the directories and files might differ.

The directories are shown in green, while the files are in black.

2 Creating the structure

- Create your <working directory> and assign a unique name to it (for example by including the release name):

```
PC $> mkdir STM32MP15-Ecosystem-v1.0.0
PC $> cd STM32MP15-Ecosystem-v1.0.0
```

- Create the first-level directories that will host the software packages delivered through the STM32MPU Embedded Software distribution release note:

```
PC $> mkdir Starter-Package
PC $> mkdir Developer-Package
PC $> mkdir Distribution-Package
```

- The resulting directory structure looks as follows:

```
STM32MP15-Ecosystem-v1.0.0
├── Developer-Package
├── Distribution-Package
└── Starter-Package
```

STM32MPU Embedded Software release
Developer Package installation directory
Distribution Package installation directory
Starter Package installation directory

Once all software packages have been installed according to the instructions given in the STM32MPU Embedded Software distribution release note, the resulting directory structure looks as follows:

```
STM32MP15-Ecosystem-v1.0.0
├── Developer-Package
│   ├── SDK
│   ├── STM32Cube_FW_MP1_V1.0.0
│   └── stm32mp1-openstlinux-4.19-thud-mp1-19-02-20
│       ├── TEE OS source code (OpenSTLinux distribution)
│       ├── Distribution-Package
│       │   ├── stm32mp1-openstlinux-4.19-thud-mp1-19-02-20
│       │   └── OpenSTLinux distribution (full source code and OpenEmbedded-based build framework)
│       └── Starter-Package
│           ├── stm32mp1-openstlinux-4.19-thud-mp1-19-02-20
│           └── Software image (binaries)
```

STM32MPU Embedded Software release
Developer Package installation
SDK for OpenSTLinux distribution
STM32CubeMP1 Package
Linux kernel, U-Boot, TF-A and OP-
Distribution Package installation
OpenSTLinux distribution (full source code and OpenEmbedded-based build framework)
Starter Package installation
Software image (binaries)

3 Focus on the Starter Package directory

The *Starter-Package* directory contains the software image for the STM32MPU Embedded Software distribution.

The trusted boot chain is the default solution delivered by STMicroelectronics. It includes the superset of features (for example, all Flash memory devices are supported). The basic boot chain is also upstreamed by STMicroelectronics, with a limited number of features (for example microSD card memory boot only). Refer to the [Boot chains overview](#) article for details.

Flash memory partitions (e.g. roofs, bootfs...) are explained in the [STM32MP15 Flash mapping](#) article.

```

4 Focus on the Developer Package directory

The *Developer-Package* directory contains:

- The source code for the following OpenSTLinux software packages (development for Arm[®] Cortex[®]-A processor):
 - Linux[®] kernel
 - U-Boot
 - TF-A
 - OP-TEE OS
- The debug symbol files for Linux kernel, U-Boot, TF-A and OP-TEE OS
- The SDK (for cross-development on an host PC)
- The STM32Cube MPU Package (developed for Arm[®] Cortex[®]-M processor)

for U-Boot build

U-Boot installation directory
ST patches for U-Boot
Makefile for the U-Boot compilation
Helper file for U-Boot management: reference

U-Boot source code directory

Appendix A shows the structure of the Linux kernel, U-Boot, TF-A and OP-TEE OS installation directories after these software packages have been built.

5 Focus on the Distribution Package directory

The *Distribution-Package* directory contains all the OpenEmbedded layers required to get the source code of any STM32MPU Embedded Software component, as well as a build framework based on OpenEmbedded.

Example of directory structure for Packages

Appendix B shows the structure of the build directory.

6 Appendix A: directory structure after build (Developer Package)

Provided you have followed the recommendations of the *README.HOW_TO.txt* helper files to build the Linux kernel, the U-Boot and the TF-A, then the following new directories and files contain the build outputs.

Example of directory structure for Packages

partition (trusted boot chain), with OP-TEE OS → STM32MP157C-EV1	tf-a-stm32mp157c-ev1-optee.stm32	TF-A binary for <i>FSBL</i>
	[...]	
	trusted	TF-A, without OP-TEE OS

Example of directory structure for Packages

7 Appendix B: directory structure after build (Distribution Package)

Provided you have followed the build method explained in OpenSTLinux distribution, then the following new directories contain the build outputs.

As long as you did not modify the source code:

- the files in **STPurple** are the same as the ones available in the **Starter Package**: flash layout, binaries for *bootfs*, *rootfs*, *userfs* and *vendorfs* partitions
- the files in grey are the same as the ones available in the **Starter and Developer Packages**: binaries for *FSBL* and *SSBL* partitions, and for OP-TEE OS runtime services
- the files in **orange** are the same as the ones available in the **Developer Package**: Linux kernel image and device tree blobs, and debug symbol files

```
