## 1 Article purpose

This article explains how to play audio through the [ALSA](#) audio framework in **Linux® OS** context. The examples below, show how to play audio on the different audio hardware interfaces of the STM32MPU boards .

## 2 Audio playback overview

The [ALSA](#) framework exposes audio devices associated to the board audio hardware interfaces.

The application audio streams are routed by default through the [PulseAudio](#) sound server. PulseAudio exposes audio profiles which are mapped on the ALSA sound card audio devices. The PulseAudio server provides a command line interface which allows to list audio profiles and to select a profile, to play on a specific audio interface.

The audio playback examples in following sections are given for [ALSA utilities](#). However, the audio playbacks can be launched by other applications, such as [gstreamer](#) multimedia framework.

## 3 Examples

### 3.1 Audio playback on headset output

#### ■ Playback on ALSA device

Run audio playback on 'playback\_codec' ALSA device:

'playback\_codec' is an alias defined in /etc/asound.conf, for headset output device.

```
Board $> aplay -D playback_codec /usr/share/sounds/alsa/Front_Left.wav
```

#### ■ Playback via PulseAudio

Change the Pulseaudio active profile of the sound card, to 'analog-stereo' profile:

The Pulseaudio analog-stereo profile is the default profile. So next command is not required after boot.

Example below is given for **sound card index 0**. Check sound cards index with "*pactl list cards short*" command.

```
Board $> pacmd set-card-profile 0 output:analog-stereo+input:analog-stereo
```

Run audio playback:

```
Board $> aplay /usr/share/sounds/alsa/Front_Left.wav
```

## 3.2 Audio playback on HDMI output

**The support of HDMI output is board dependent. Please, check available outputs with "*aplay -l*" command.**

#### ■ Playback on ALSA device

Run audio playback on 'playback\_hdmi' ALSA device:

'playback\_hdmi' is an alias defined in /etc/asound.conf, for hdmi output device.

```
Board $> aplay -D playback_hdmi /usr/share/sounds/alsa/Front_Left.wav
```

#### ■ Playback via PulseAudio

Change the Pulseaudio active profile of the sound card, to 'hdmi-stereo' profile:

Example below is given for **sound card index 0**. Check sound card index with "*pactl list cards short*" command.

```
Board $> pacmd set-card-profile 0 output:hdmi-stereo
```

Run audio playback:

```
Board $> aplay /usr/share/sounds/alsa/Front_Left.wav
```

### 3.3 Audio playback on S/PDIF output

The support of S/PDIF output is board dependent. Please, check available outputs with "*aplay -l*" command.

S/PDIF ALSA device supports only **32-bit audio streams**. As 32-bit wave files are not provided in sample sound files, *speaker-test* is used instead of *aplay*, for convenience, here. *Speaker-test* generates a 440Hz sine wave in following examples.

#### ■ Playback on ALSA device

Run audio playback on 'playback\_spdif' ALSA device:

'playback\_spdif' is an alias defined in */etc/asound.conf*, for S/PDIF output device.

```
Board $> speaker-test -D playback_spdif -c 2 -F S32_LE -f 440 -t sine -l 1
```

#### ■ Playback via PulseAudio

Change the sound card active profile, to S/PDIF 'iec958-stereo' profile.

Example below is given for **sound card index 0**. Check sound card index with "*pactl list cards short*" command.

```
Board $> pacmd set-card-profile 0 output:iec958-stereo
```

Run audio playback:

```
Board $> speaker-test -c 2 -F S32_LE -f 440 -t sine -l 1
```
